TVEM Macro Output Summary

```
================================================================
Time-Varying Effects Modeling (TVEM) Macro Output
================================================================
Dataset:                  SASUSER.OSM23
Time variable:            timetodeath_rev
Response variable:        intrinsic_pomp
Response distribution:    Normal (Gaussian)
Random effects:           Intercept
Time-varying effects:     intercept
Knots for splines:        5
Degree for splines:       3
Number of observations used:         74369
Internal computations in PROC GLIMMIX converged successfully.
================================================================
Log-likelihood (less negative=better fit):               -247100.951
AIC (smaller=better fit):                                 494223.902
BIC (smaller=better fit):                                 494325.285
================================================================
The estimated coefficient functions are stored in the dataset tvem_plot_data.
================================================================
